DETAILED ACTION

Allowable Subject Matter

1. The following is an examiner's statement of reasons for allowance:

Independent claims 1, 9, 17, 18, and 19 identify the unique distinct feature of:

“A color image processing method for converting a first color signal including three variables into a second color signal including N variables, where N is an integer, which is not smaller than five, the second color signal to be output to an image forming device which executes a print process with N colors, the color image processing method comprising: a first conversion of determining (N-3) variables of the second color signal from the first color signal; a second conversion of determining the remaining three variables of the second color signal on the basis of the determined (N-3) variables of the second color signal and the three variables of the first color signal so that the second color signal is colorimetrically equal to the first color signal; and outputting, as the second color signal, the determined (N-3) variables and the determined remaining three variables to the image forming device, wherein the first conversion of determining determines the (N-3) variables before the remaining three variables of the second color signal are determined, the (N-3) variables being determined on the basis of a UCR ratio of each of the (N-3) variables and a maximum value of each of the (N-3) variables, such that a color represented by a combination of the (N-3) variables is within a color gamut of the image forming device.”

The closest prior art Velde'438 and Mahy'195 teach separating an input color defined in a trajectory space into colorants in a color space and using a Neugebauer equation to determine the most stable solution for 3-ink processes.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
